Logic reasoning systems

Milos Hauskrecht
milos@cs.pitt.edu
5329 Sennott Square

Administration

• No class next week
• PS-5:
  – Due on Thursday, October 14, 2004
  – Submit directly to Tomas Singliar
• Midterm:
  – October 19, 2004 during the class
    • Closed book
    • Covers:
      Search and Knowledge Representation
Optimization competition winners

CS2710 Homework 3

Genetic Algorithm

1. Yan Wang
2. Swapna Somasundaran
3. Mahmoud Elhaddad
Simulated annealing

1. Jose Nunez-Varela

2. Yang Wang

3. Swapna Somasundaran

Honorable mentions:
- Jose Baiocchi
- Mahmoud Elhaddad
- Lin Qi
- Jonathan Misurda

Knowledge-based system

| Knowledge base | Inference engine |

- **Knowledge base:**
  - A set of sentences that describe the world in some formal (representational) language (e.g. first-order logic)
  - Domain specific knowledge

- **Inference engine:**
  - A set of procedures that work upon the representational language and can infer new facts or answer KB queries (e.g. resolution algorithm, forward chaining)
  - Domain independent
Automated reasoning systems

Examples and main differences:

- **Theorem provers**
  - Prove sentences in the first-order logic. Use inference rules, resolution rule and resolution refutation.

- **Deductive retrieval systems**
  - Systems based on rules (KBs in Horn form)
  - Prove theorems or infer new assertions (forward, backward chaining)

- **Production systems**
  - Systems based on rules with actions in antecedents
  - Forward chaining mode of operation

- **Semantic networks**
  - Graphical representation of the world, objects are nodes in the graphs, relations are various links

Production systems

Based on rules, but different from KBs in the Horn form

Knowledge base is divided into:

- **A Rule base (includes rules)**
- **A Working memory (includes facts)**

A special type of if – then rule

\[ p_1 \land p_2 \land \cdots \land p_n \Rightarrow a_1, a_2, \ldots, a_k \]

- **Antecedent**: a conjunction of literals
  - facts, statements in predicate logic
- **Consequent**: a conjunction of actions. An action can:
  - **ADD** the fact to the KB (working memory)
  - **REMOVE** the fact from the KB (consistent with logic ?)
  - **QUERY** the user, etc …

CS 2710 Foundations of AI
Production systems

Based on rules, but different from KBs in the Horn form
Knowledge base is divided into:

• A Rule base (includes rules)
• A Working memory (includes facts)

A special type of if – then rule

\[ p_1 \land p_2 \land \ldots \land p_n \implies a_1, a_2, \ldots, a_k \]

• Antecedent: a conjunction of literals
  – facts, statements in predicate logic
• Consequent: a conjunction of actions. An action can:
  – ADD the fact to the KB (working memory)
  – REMOVE the fact from the KB ⤿!!! Different from logic
  – QUERY the user, etc …

Use forward chaining to do reasoning:
  – If the antecedent of the rule is satisfied (rule is said to be “active”) then its consequent can be executed (it is “fired”)

• Problem: Two or more rules are active at the same time. Which one to execute next?

<table>
<thead>
<tr>
<th>Rule</th>
<th>Conditions</th>
<th>Actions</th>
</tr>
</thead>
<tbody>
<tr>
<td>R27</td>
<td>Conditions R27 ✓</td>
<td>Actions R27 ?</td>
</tr>
<tr>
<td>R105</td>
<td>Conditions R105 ✓</td>
<td>Actions R105 ?</td>
</tr>
</tbody>
</table>

• Strategy for selecting the rule to be fired from among possible candidates is called conflict resolution
Production systems

• Why is conflict resolution important? Or, Why do we care about the order?

• Assume that we have two rules and the preconditions of both are satisfied:

  **R1:** \( A(x) \land B(x) \land C(y) \Rightarrow add \ D(x) \)

  **R2:** \( A(x) \land B(x) \land E(z) \Rightarrow delete \ A(x) \)

• What can happen if rules are triggered in different order?

  – If R1 goes first, R2 condition is still satisfied and we infer \( D(x) \)
  
  – If R2 goes first we may never infer \( D(x) \)
Production systems

- **Problems with production systems:**
  - Additions and Deletions can change a set of active rules;
  - If a rule contains variables testing all instances in which the rule is active may require a large number of unifications.
  - Conditions of many rules may overlap, thus requiring to repeat the same unifications multiple times.

- **Solution: Rete algorithm**
  - gives more efficient solution for managing a set of active rules and performing unifications
  - Implemented in the system **OPS-5** (used to implement XCON – an expert system for configuration of DEC computers)

---

Rete algorithm

- Assume a set of rules:
  
  \[ A(x) \land B(x) \land C(y) \Rightarrow add \ D(x) \]
  
  \[ A(x) \land B(y) \land D(x) \Rightarrow add \ E(x) \]
  
  \[ A(x) \land B(x) \land E(z) \Rightarrow delete \ A(x) \]

- And facts: 
  \[ A(1), A(2), B(2), B(3), B(4), C(5) \]

- **Rete:**
  - Compiles the rules to a network that merges conditions of multiple rules together (avoid repeats)
  - Propagates valid unifications
  - Reevaluates only changed conditions
**Conflicts resolution strategies**

**Problem:** Two or more rules are active at the same time. Which one to execute next?

**Solutions:**
- **No duplication** (do not execute the same rule twice)
- **Recency.** Rules referring to facts newly added to the working memory take precedence
- **Specificity.** Rules that are more specific are preferred.
- **Priority levels.** Define priority of rules, actions based on expert opinion. Have multiple priority levels such that the higher priority rules fire first.
Semantic network systems

- Knowledge about the world described in terms of graphs. Nodes correspond to:
  - **Concepts or objects** in the domain.

  Links to relations. Three kinds:
  - **Subset links** (isa, part-of links)
  - **Member links** (instance links)
  - **Function links**.

- Can be transformed to the first-order logic language
- Graphical representation is often easier to work with
  - better overall view on individual concepts and relations

---

Semantic network. Example.

**Inferred properties:** *Queen Mary is a ship*
*Queen Mary has a boiler*
Representation of actions, situations, events

The world is dynamic:
• What is true now may not be true tomorrow
• Changes in the world may be triggered by our activities

Problems:
• Logic (FOL) as we had it referred to a static world. How to represent the change in the FOL?
• How to represent actions we can use to change the world?

Planning problem:
• find a sequence of actions that achieves some goal in this complex world?
• A very complex search problem

Situation calculus

Provides a framework for representing change, actions and reasoning about them

• Situation calculus
  – based on first-order logic,
  – a situation variable models new states of the world
  – action objects model activities
  – uses inference methods developed for FOL to do the reasoning
  (show that a specific situation can be achieved from an initial state)
Situation calculus

- Logic for reasoning about changes in the state of the world
- **The world is described by:**
  - Sequences of **situations** of the current state
  - Changes from one situation to another are caused by actions
- **The situation calculus allows us to:**
  - Describe the initial state and goal state of the works
  - Build the KB that describes the effect of actions (operators)
  - Prove that the KB allows us to derive (prove) the goal state
    - and thereby allow us to extract a plan

Situation calculus

The language is based on the First-order logic plus:
- **Special variables:** \(s, a\) – objects of type situation and action
- **Action functions** that return actions.
  - E.g. \(\text{Move}(A, \text{TABLE}, B)\) represents a move action
  - \(\text{Move}(x,y,z)\) represents an action schema
- **Two special function symbols of type situation**
  - \(s_0\) – initial situation
  - \(DO(a,s)\) – denotes the situation obtained after performing an action \(a\) in situation \(s\)
- **Situation-dependent functions and relations** (also called **fluents**)
  - **Relation:** \(\text{On}(x,y,s)\) – object \(x\) is on object \(y\) in situation \(s\);
  - **Function:** \(\text{Above}(x,s)\) – object that is above \(x\) in situation \(s\).
## Situation calculus. Blocks world example.

**Initial state**

- On(A, Table, s₀)
- On(B, Table, s₀)
- On(C, Table, s₀)
- Clear(A, s₀)
- Clear(B, s₀)
- Clear(C, s₀)
- Clear(Table, s₀)

**Goal**

Find a state (situation) s, such that

- On(A, B, s)
- On(B, C, s)
- On(C, Table, s)

---

## Blocks world example.

**Initial state**

- On(A, Table, s₀)
- On(B, Table, s₀)
- On(C, Table, s₀)
- Clear(A, s₀)
- Clear(B, s₀)
- Clear(C, s₀)
- Clear(Table, s₀)

**Goal**

- On(A, B, s)
- On(B, C, s)
- On(C, Table, s)

**Note:** It is not necessary that the goal describes all relations

- Clear(A, s)
Blocks world example.

**Assume a simpler goal** $On(A,B, s)$

```
A  B  C  
```

**Initial state**

- $On(A, Table, s_0)$
- $On(B, Table, s_0)$
- $On(C, Table, s_0)$
- $Clear(A, s_0)$
- $Clear(B, s_0)$
- $Clear(C, s_0)$
- $Clear(Table, s_0)$

3 possible goal configurations

```
C  A  B  
```

**Goal** $On(A,B, s)$

Knowledge about the world. Axioms.

Knowledge base we need to built to support the reasoning:

- Must represent changes in the world due to actions.

Two types of axioms:

- **Effect axioms**
  - changes in situations that result from actions
- **Frame axioms**
  - things preserved from the previous situation
Blocks world example. Effect axioms.

**Effect axioms:**

Moving x from y to z. \( MOVE (x, y, z) \)

Effect of move changes on **On** relations

\[
On(x, y, s) \land Clear(x, s) \land Clear(z, s) \rightarrow On(x, z, DO(MOVE(x, y, z), s))
\]

\[
On(x, y, s) \land Clear(x, s) \land Clear(z, s) \rightarrow \neg On(x, y, DO(MOVE(x, y, z), s))
\]

Effect of move changes on **Clear** relations

\[
On(x, y, s) \land Clear(x, s) \land Clear(z, s) \rightarrow Clear(y, DO(MOVE(x, y, z), s))
\]

\[
On(x, y, s) \land Clear(x, s) \land Clear(z, s) \land (z \neq Table)
\rightarrow \neg Clear(z, DO(MOVE(x, y, z), s))
\]

Blocks world example. Frame axioms.

- **Frame axioms.**
  - Represent things that remain unchanged after an action.

**On relations:**

\[
On(u, v, s) \land (u \neq x) \land (v \neq y) \rightarrow On(u, v, DO(MOVE(x, y, z), s))
\]

**Clear relations:**

\[
Clear(u, s) \land (u \neq z) \rightarrow Clear(u, DO(MOVE(x, y, z), s))
\]
Planning in situation calculus.

Planning problem:
- find a sequence of actions that lead to a goal

Planning in situation calculus is converted to theorem proving.
Goal state:
\[ \exists s \, \text{On}(A, B, s) \land \text{On}(B, C, s) \land \text{On}(C, \text{Table}, s) \]

- Possible inference approaches:
  - Inference rule approach
  - Conversion to SAT
- Plan (solution) is a byproduct of theorem proving.
- Example: blocks world

Planning in a blocks world.

<table>
<thead>
<tr>
<th>A</th>
<th>B</th>
<th>C</th>
</tr>
</thead>
<tbody>
<tr>
<td>A</td>
<td>B</td>
<td>C</td>
</tr>
</tbody>
</table>

Initial state
- \text{On}(A, \text{Table}, s_0)
- \text{On}(B, \text{Table}, s_0)
- \text{On}(C, \text{Table}, s_0)
- \text{Clear}(A, s_0)
- \text{Clear}(B, s_0)
- \text{Clear}(C, s_0)
- \text{Clear}(\text{Table}, s_0)

Goal
- \text{On}(A, B, s)
- \text{On}(B, C, s)
- \text{On}(C, \text{Table}, s)
Planning in the blocks world.

Initial state (s₀)

\[
\begin{align*}
&\text{On}(A, \text{Table}, s₀) \quad \text{Clear} (A, s₀) \quad \text{Clear} (\text{Table}, s₀) \\
&\text{On}(B, \text{Table}, s₀) \quad \text{Clear} (B, s₀) \\
&\text{On}(C, \text{Table}, s₀) \quad \text{Clear} (C, s₀)
\end{align*}
\]

Action: \( \text{MOVE} (B, \text{Table}, C) \)

\[
\begin{align*}
s₁ &= \text{DO}(\text{MOVE} (B, \text{Table}, C), s₀) \\
&\text{On}(A, \text{Table}, s₁) \quad \text{Clear} (A, s₁) \quad \text{Clear} (\text{Table}, s₁) \\
&\text{On}(B, C, s₁) \quad \text{Clear} (B, s₁) \\
&\neg\text{On}(B, \text{Table}, s₁) \quad \neg\text{Clear} (C, s₁)
\end{align*}
\]

Planning in the blocks world.

Initial state (s₀)

\[
\begin{align*}
&\text{On}(A, \text{Table}, s₀) \quad \text{Clear} (A, s₀) \quad \text{Clear} (\text{Table}, s₀) \\
&\text{On}(B, \text{Table}, s₀) \quad \text{Clear} (B, s₀) \\
&\text{On}(C, \text{Table}, s₀) \quad \text{Clear} (C, s₀)
\end{align*}
\]

Action: \( \text{MOVE} (A, \text{Table}, B) \)

\[
\begin{align*}
s₂ &= \text{DO}(\text{MOVE} (A, \text{Table}, B), s₁) \\
&= \text{DO}(\text{MOVE} (A, \text{Table}, B), \text{DO}(\text{MOVE} (B, \text{Table}, C), s₀)) \\
&\text{On}(A, B, s₂) \quad \neg\text{On}(A, \text{Table}, s₂) \quad \neg\text{Clear} (B, s₂) \\
&\text{On}(B, C, s₂) \quad \neg\text{On}(B, \text{Table}, s₂) \quad \neg\text{Clear} (C, s₂) \\
&\text{On}(C, \text{Table}, s₂) \quad \text{Clear} (A, s₂) \quad \text{Clear} (\text{Table}, s₂)
\end{align*}
\]
Planning in situation calculus.

Planning problem:
- Find a sequence of actions that lead to a goal
- Is a special type of a search problem
- Planning in situation calculus is converted to theorem proving.

Problems:
- Large search space
- Large number of axioms to be defined for one action
- Proof may not lead to the best (shortest) plan.
