

CS 1550

Week 2

Lab 1 – xv6 Introduction

Setup and exercise

Teaching Assistant

Henrique Pötter

Recitation TA – Office Hours

- Office Hours (SENSQ 6507)
 - Tuesday:
 - 10:00 am to 11:00 am / 6:00 pm to 7:00 pm
 - Wednesday:
 - 10:00 am to 12:00 pm
 - Friday:
 - 10:00 am to 12:00 pm
- Email
 - potter.hp@pitt.edu
- TA Website
 - <http://people.cs.pitt.edu/~henriquepotter/>

CS 1550 – Kernel Space vs User Space

- Hardware Resources
 - CPU
 - Memory (Address space)
 - I/O devices (Disk, mouse, display, sound, network, etc.)
 - Power and System Management

CS 1550 – Kernel Space vs User Space

- Hardware Resources
 - CPU
 - Memory (Address space)
 - I/O devices (Disk, mouse, display, sound, network, etc.)
 - Power and System Management

CS 1550 – Kernel Space vs User Space

- **Abstraction**

- Hides details of different hardware configurations
- Applications do not need to be tailored for each possible device that might be present on a system

CS 1550 – Kernel Space vs User Space

- **Arbitration**

- Manages access to shared hardware resources
- Enables multiple applications to share the same hardware simultaneously

CS 1550 – Kernel Space vs User Space

- OS is **just** another **software**
- User applications should not change the kernel (OS software)

CS 1550 – Kernel Space vs User Space

- User space
 - **Less privileged memory space** where user processes execute
- Kernel space
 - **Privileged memory space** where the OS main process resides
 - **No User application should be able to change**

CS 1550 – Kernel Space vs User Space

- User space
 - **Less privileged memory space** where user processes execute
- Kernel space
 - **Privileged memory space** where the OS main process resides
 - **No User application should be able to change**

CS 1550 – Kernel Space vs User Space

- **System Call**

- User processes must execute system calls to access OS resources and hardware

CS 1550 – Kernel Space vs User Space

- **System Call**

- User processes must execute system calls to access OS resources and hardware

CS 1550 – Kernel Space vs User Space

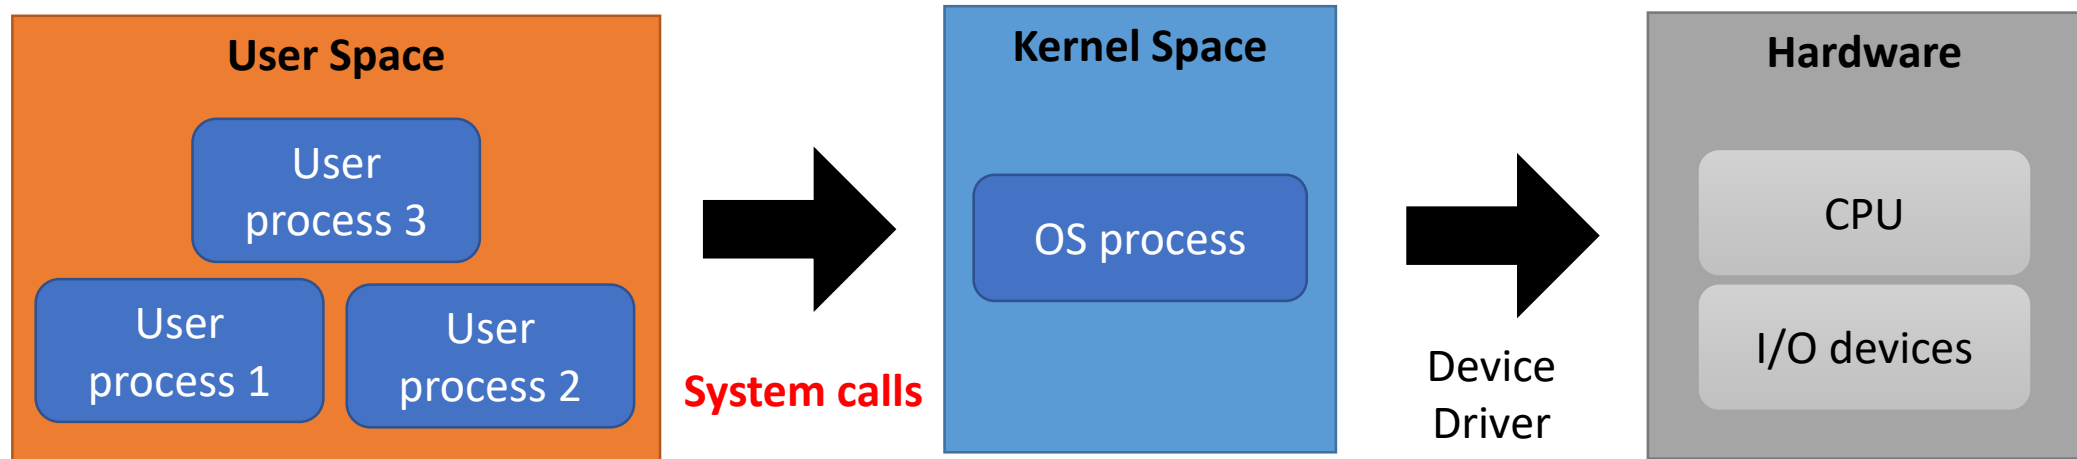

- **System Call**

- User processes must execute system calls to access OS resources and hardware

CS 1550 – Kernel Space vs User Space

- **System Call (OS function)**
 - User processes must execute system calls to access OS resources and hardware

System Call - exercise

CS 1550 – xv6

- Simple Unix-like **operating system** for teaching, developed in 2006.
 - Provides basic services for running programs
 - https://pdos.csail.mit.edu/6.828/2012/xv6.html?utm_source=dlvr.it&utm_medium=tumblr

A black rectangular box with the text "xv6 OS" in yellow, sans-serif font.

xv6 OS

CS 1550 – xv6

- Has a **subset of traditional** system calls
 - **fork()** Create process
 - **exit()** Terminate current process
 - **wait()** Wait for a child process
 - **kill(pid)** Terminate process pid
 - **getpid()** Return current process's id
 - **sleep(n)** Sleep for n time units
 - **exec(filename, *argv)** Load a file and execute it
 - **sbrk(n)**
 -

CS 1550 – xv6

- Compile and Run xv6 in a cs pitt server

xv6 OS

Run where?

CS 1550 – xv6

- Compile and Run xv6 in a cs pitt server
 - Since it is an OS how can we run it?

xv6 OS

Run where?

CS 1550 – xv6

- Compile and Run xv6 in a cs pitt server

CS 1550 – xv6

- Compile and Run xv6 in a cs pitt server

CS 1550 – Compile and Run xv6

1. Extend disk Quota, if you have less then 500mb free space
 - a) Log in to <https://my.pitt.edu>
 - b) Click on "Profile" at the top-right corner of the screen
 - c) Click on "Manage Your Account"
 - d) Click on "EMAIL & MESSAGING" -> "UNIX QUOTA"
 - e) Click on "Increase My UNIX Quota"

CS 1550 – Compile and Run xv6

1. Extend disk Quota, if you have less then 500mb free space
 - a) Log in to <https://my.pitt.edu>
 - b) Click on "Profile" at the top-right corner of the screen
 - c) Click on "Manage Your Account"
 - d) Click on "EMAIL & MESSAGING" -> "UNIX QUOTA"
 - e) Click on "Increase My UNIX Quota"

CS 1550 – xv6

- Log in to **linux.cs.pitt.edu**
 - **ssh user_name@linux.cs.pitt.edu**
- Download the xv6 source code from github
 - **git clone git://github.com/mit-pdos/xv6-public.git**
- Get into the cloned xv6 source code folder
 - **cd xv6-public**
- Compile and run the code with
 - **make qemu-nox** 

Compiles and run xv6 with qemu
 - qemu-nox run the console version of the emulator

CS 1550 – xv6

```
linux.cs.pitt.edu - PuTTY
(8) thompson $ make qemu-nox
qemu-system-i386 -nographic -drive file=fs.img,index=1,media=disk,format=raw -drive file=xv6.img,index=0,media=disk,format=raw -smp 2 -m 512

(process:118651): GLib-WARNING **: gmem.c:483: custom memory allocation vtable not supported
xv6...
cpu1: starting 1
cpu0: starting 0
sb: size 1000 nblocks 941 ninodes 200 nlog 30 logstart 2 inodestart 32 bmap start 58
init: starting sh
$
```

CS 1550 – xv6

- Compile and Run xv6 in a cs pitt server

CS 1550 – xv6

- Compile and Run xv6 in a cs pitt server

```
(3) kernighan $ make qemu-nox
qemu-system-i386 -nographic -drive file=fs.img,index=1,media=disk,for
(process:128413): GLib-WARNING **: gmem.c:483: custom memory allocati
xv6...
cpu1: starting 1
cpu0: starting 0
sb: size 1000 nblocks 941 ninodes 200 nlog 30 logstart 2 inodestart 1
init: starting sh
$
```

CS 1550 – xv6

- Once in xv6 you can call **ls**

```
cat          2 3 14484
echo         2 4 13340
forktest     2 5 8164
grep         2 6 16020
init         2 7 14232
kill         2 8 13372
ln           2 9 13312
ls           2 10 16172
mkdir        2 11 13404
rm           2 12 13380
sh           2 13 24820
stressfs     2 14 14328
usertests    2 15 67260
wc           2 16 15148
zombie       2 17 13040
console      3 18 0
temp         1 19 32
$
```

CS 1550 – xv6 – Adding a custom Syscall

- Add a syscall “getday”
- Return the date we hardcoded in the source file

CS 1550 – xv6 – Adding a custom Syscall

- First, we need to define our new call and its number at
 - **syscall.h**

A screenshot of a code editor window with two tabs: 'syscall.h' and 'syscall.c'. The 'syscall.h' tab is active, showing a list of system call definitions. The code is as follows:

```
1 // System call numbers
2 #define SYS_fork    1
3 #define SYS_exit    2
4 #define SYS_wait    3
5 #define SYS_pipe    4
6 #define SYS_read    5
7 #define SYS_kill    6
8 #define SYS_exec    7
9 #define SYS_fstat    8
10 #define SYS_chdir   9
11 #define SYS_dup     10
12 #define SYS_getpid  11
13 #define SYS_sbrk    12
14 #define SYS_sleep   13
15 #define SYS_uptime  14
16 #define SYS_open    15
17 #define SYS_write   16
18 #define SYS_mknod   17
```

CS 1550 – xv6 – Adding a custom Syscall

- First, we need to define our new call and its number at
 - **syscall.h**
- Add
 - `#define SYS_getday 22`

A screenshot of a code editor window with two tabs: 'syscall.h' and 'syscall.c'. The 'syscall.h' tab is active, showing a list of system call definitions. The code is as follows:

```
1 // System call numbers
2 #define SYS_fork    1
3 #define SYS_exit    2
4 #define SYS_wait    3
5 #define SYS_pipe    4
6 #define SYS_read    5
7 #define SYS_kill    6
8 #define SYS_exec    7
9 #define SYS_fstat    8
10 #define SYS_chdir   9
11 #define SYS_dup     10
12 #define SYS_getpid  11
13 #define SYS_sbrk    12
14 #define SYS_sleep   13
15 #define SYS_uptime  14
16 #define SYS_open    15
17 #define SYS_write   16
18 #define SYS_mknod   17
```

CS 1550 – xv6 – Adding a custom Syscall

- Next, we need to map the new call in the array pointer of system calls

- **syscall.c**

- Add

- [SYS_getday] sys_getday,

```
110
111 static int (*syscalls[]) (void) = {
112     [SYS_fork]      sys_fork,
113     [SYS_exit]      sys_exit,
114     [SYS_wait]      sys_wait,
115     [SYS_pipe]      sys_pipe,
116     [SYS_read]      sys_read,
117     [SYS_kill]      sys_kill,
118     [SYS_exec]      sys_exec,
119     [SYS_fstat]     sys_fstat,
120     [SYS_chdir]     sys_chdir,
121     [SYS_dup]       sys_dup,
122     [SYS_getpid]    sys_getpid,
123     [SYS_sbrk]      sys_sbrk,
124     [SYS_sleep]     sys_sleep,
125     [SYS_uptime]    sys_uptime,
126     [SYS_open]      sys_open,
127     [SYS_write]     sys_write,
```

CS 1550 – xv6 – Adding a custom Syscall

- Next, we need to map the new call in the array pointer of system calls
 - **syscall.c**
- Add
 - [SYS_getday] sys_getday,
- Add
 - extern int sys_getday(void);

```
94  extern int sys_link(void);
95  extern int sys_mkdir(void);
96  extern int sys_mknod(void);
97  extern int sys_open(void);
98  extern int sys_pipe(void);
99  extern int sys_read(void);
100 extern int sys_sbrk(void);
101 extern int sys_sleep(void);
102 extern int sys_unlink(void);
103 extern int sys_wait(void);
104 extern int sys_write(void);
105 extern int sys_uptime(void);
106
107 static int (*syscalls[])(void) = {
108     [SYS_fork]    sys_fork,
109     [SYS_exit]    sys_exit,
110     [SYS_wait]    sys_wait,
```

CS 1550 – xv6 – Adding a custom Syscall

- Then we need to implement the actual method
- In xv6 this is organized in two files.
 - `sysfile.c` -> file related system calls
 - `sysproc.c` -> all the other syscalls

CS 1550 – xv6 – Adding a custom Syscall

- Then we need to implement the actual method
- In xv6 this is organized in two files.
 - `sysfile.c` -> file related system calls
 - **`sysproc.c` -> all the other syscalls**

CS 1550 – xv6 – Adding a custom Syscall

- Then we need to implement the actual method
- In xv6 this is organized in two files.
 - sysfile.c -> file related system calls
 - **sysproc.c -> all the other syscalls**

```
int
sys_getday(void)
{
    return 6;
}
```

```
syscall.h x syscall.c x sysproc.c x
4  #include "date.h"
5  #include "param.h"
6  #include "memlayout.h"
7  #include "mmu.h"
8  #include "proc.h"
9
10 int
11 sys_fork(void)
12 {
13     return fork();
14 }
15
16 int
17 sys_exit(void)
18 {
19     exit();
20     return 0; // not reached
21 }
```

CS 1550 – xv6 – Adding a custom Syscall

- Afterwards we define the interface for user programs to call
 - Open usys.S
- Add
 - SYSCALL(getday)

```
syscall.h x syscall.c x sysproc.c x usys.S x
1  #include "syscall.h"
2  #include "traps.h"
3
4  #define SYSCALL(name) \
5      .globl name; \
6      name: \
7          movl $SYS_ ## name, %eax; \
8          int $T_SYSCALL; \
9          ret
10
11 SYSCALL(fork)
12 SYSCALL(exit)
13 SYSCALL(wait)
14 SYSCALL(pipe)
15 SYSCALL(read)
16 SYSCALL(write)
17 SYSCALL(close)
18 SYSCALL(kill)
```

CS 1550 – xv6 – Adding a custom Syscall

- Finally we open
 - user.h
- Add
 - int getday(void);

A screenshot of a code editor window with five tabs: syscall.h, syscall.c, sysproc.c, usys.S, and user.h. The user.h tab is active, showing a list of system call prototypes. The code is as follows:

```
1 struct stat;
2 struct rtcdate;
3
4 // system calls
5 int fork(void);
6 int exit(void) __attribute__((noreturn));
7 int wait(void);
8 int pipe(int*);
9 int write(int, const void*, int);
10 int read(int, void*, int);
11 int close(int);
12 int kill(int);
13 int exec(char*, char**);
14 int open(const char*, int);
15 int mknod(const char*, short, short);
16 int unlink(const char*);
17 int fstat(int fd, struct stat*);
```

CS 1550 – xv6 – Adding a custom Syscall

- Example user program
 - todays_date.c

```
#include "types.h"
#include "stat.h"
#include "user.h"

int main(void) {
    printf(1, "Today is %d\n", getday());
    exit();
}
```

CS 1550 – xv6 – Adding a custom Syscall

- Adding a user program
 - Open makefile
- Add
 - `_today's_date\`

```
166 .PRECIOUS: %.o
167
168 UPROGS=\
169     _cat\
170     _echo\
171     _forktest\
172     _grep\
173     _init\
174     _kill\
175     _ln\
176     _ls\
177     _mkdir\
178     _rm\
179     _sh\
180     _stressfs\
181     _usertests\
182     _wc\
183     _zombie\
184
```

CS 1550 – xv6 – Adding a custom Syscall

- Adding a user program
 - Open makefile
- and add
 - `today's_date.c\`

```
250 EXTRA=\n251 mkfs.c ulib.c user.h cat.c echo.c forktest.c grep.c kill.c\n252 ln.c ls.c mkdir.c rm.c stressfs.c usertests.c wc.c zombie.c\n253\n254 printf.c umalloc.c\n255 README dot-bochsrc *.pl toc.* runoff runoffl runoff.list\n256 .gdbinit.tmpl gdbutil\n257\ndist:\n258\n259 rm -rf dist\n260 mkdir dist\n261 for i in $(FILES); \n262 do \n263
```

CS 1550 – xv6 – Adding a custom Syscall

- Adding a user program
 - Open makefile
- and add
 - `todays_date.c\`
- Finally execute
 - `make qemu-nox`
- Run the program by calling it directly within xv6
 - `todays_date`

CS 1550 – xv6 – Adding a custom Syscall

- To exit xv6 (after executing make qemu-nox)
 - Press **ctrl+a (together)** and then press **c** and write **quit**

```
linux.cs.pitt.edu - PuTTY
sb: size 1000 nblocks 941 ninode
init: starting sh
$ ls
.          1 1 512
..         1 1 512

CS 1550 – xv6 Lab 1

- We need to worry about two things:
 - How to count syscalls?
 - Implement the method to return the number of syscalls

CS 1550 – xv6 exercise hints

- We need to worry about two things:
 - How to count syscalls?
 - Implement the method to return the number of syscalls

CS 1550 – xv6 exercise hints

- Syscall calls will need a variable to hold the counting values
 - Where to write this data structure?
 - Which file holds processes metadata? `proc.c`
 - Which data structure?
 - Each syscall have an id, which could be used as?
 - Which basic data structure uses indices for element positions?
 - Important method can be found in `syscall.c`
 - `syscall(void)` -> Is called every time any syscall is called

CS 1550 – xv6 exercise hints

```
void
syscall(void)
{
    int num;
    struct proc *curproc = myproc();

    num = curproc->tf->eax;
    if(num > 0 && num < NELEM(syscalls) && syscalls[num]) {
        curproc->tf->eax = syscalls[num]();
    } else {
        cprintf("%d %s: unknown sys call %d\n",
            curproc->pid, curproc->name, num);
        curproc->tf->eax = -1;
    }
}
```

The system call numbers match the entries in the syscalls array, a table of function pointers

CS 1550 – xv6 exercise hints

- Implementing **getcount**
 - Specify the method and its **id** in **syscall.h**
 - Specify extern method and pointer
 - **syscall.c**
 - Where to implement int **sys_getcount(void)**?
 - **sysproc.c**
 - Add SYSCALL(getcount)
 - **usys.S**
 - **getcount.c**
 - Modify **proc.c**, **proc.h** according to your method of counting.
 - Declare counting array?
 - Initialize counting array?
 - Makefile

CS 1550 – xv6 exercise hints

- Submit to GradeScope the files that you have modified within the source code of xv6.
- You should modify the following files only:
 - syscall.h
 - syscall.c
 - user.h
 - usys.S
 - proc.h
 - proc.c
 - sysproc.c
 - Makefile

CS 1550 – Reminder

- **Lab 1**
 - **Due:** Friday, 01/28 @ 11:59pm
- Email
 - potter.hp@pitt.edu
- TA Website
 - <http://people.cs.pitt.edu/~henriquepotter/>
