

Differences between \subseteq and \in

Recall that $A \subseteq B$ if A is a **subset** of B, whereas $a \in A$ means that a is an **element** of A.

Examples:

- Is $\{1\} \in \{1, 2, 3\}$? **No!**
- Is $\{1\} \subseteq \{1, 2, 3\}$? **Yes!**
- Is $1 \in \{1, 2, 3\}$?
- Is $\{2, 3\} \subseteq \{1, \{2, 3\}, \{4, 5\}\}$?
- Is $\{2, 3\} \in \{1, \{2, 3\}, \{4, 5\}\}$?
- Is $\emptyset \in \{1, 2, 3\}$?
- Is $\emptyset \subseteq \{1, 2, 3\}$?

Be careful when computing power sets

Question: What is $P(\{1, 2, \{1, 2\}\})$?

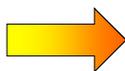

Note: The set $\{1, 2, \{1, 2\}\}$ has three elements

- 1
- 2
- $\{1, 2\}$

So, we need all combinations of those elements:

- \emptyset
- $\{1\}$
- $\{2\}$
- $\{\{1,2\}\}$
- $\{1, 2\}$
- $\{1, \{1,2\}\}$
- $\{2, \{1,2\}\}$
- $\{1, 2, \{1, 2\}\}$

$$\therefore P(\{1, 2, \{1,2\}\}) = \{\emptyset, \{1\}, \{2\}, \{\{1,2\}\}, \{1, 2\}, \{1, \{1,2\}\}, \{2, \{1,2\}\}, \{1, 2, \{1,2\}\}$$

This power set has $2^3 = 8$ elements.

Today's Topics

Sequences and Summations

- Specifying and recognizing sequences
- Summation notation
- Closed forms of summations
- Cardinality of infinite sets

Sequences are ordered lists of elements

Definition: A **sequence** is a function from the set of integers to a set S . We use the notation a_n to denote the image of the integer n . a_n is called a **term** of the sequence.

Examples:

- 1, 3, 5, 7, 9, 11 A sequence with 6 terms
- 1, 1/2, 1/3, 1/4, 1/5, ... An infinite sequence

Note: The second example can be described as the sequence $\{a_n\}$ where $a_n = 1/n$

What makes sequences so special?

Question: Aren't sequences just sets?

Answer: The elements of a sequence are members of a set, but a sequence is **ordered**, a set is not.

Question: How are sequences different from ordered n-tuples?

Answer: An ordered n-tuple is ordered, but always contains n elements. Sequences can be infinite!

Some special sequences

Geometric progressions are sequences of the form $\{ar^n\}$ where a and r are real numbers

Examples:

- 1, 1/2, 1/4, 1/8, 1/16, ... $a = 1, r = 1/2$
- 1, -1, 1, -1, 1, -1, ...

Arithmetic progressions are sequences of the form $\{a + nd\}$ where a and d are real numbers.

Examples:

- 2, 4, 6, 8, 10, ...
- -10, -15, -20, -25, ...

Sometimes we need to figure out the formula for a sequence given only a few terms

Questions to ask yourself:

1. Are there runs of the same value?
2. Are terms obtained by multiplying the previous value by a particular amount? (Possible geometric sequence)
3. Are terms obtained by adding a particular amount to the previous value? (Possible arithmetic sequence)
4. Are terms obtained by combining previous terms in a certain way?
5. Are there cycles amongst terms?

What are the formulas for these sequences?

Problem 1: 1, 5, 9, 13, 17, ...

Problem 2: 1, 3, 9, 27, 81, ...

Problem 3: 2, 3, 3, 5, 5, 5, 7, 7, 7, 7, 11, 11, 11, 11, 11, ...

Problem 4: 1, 1, 2, 3, 5, 8, 13, 21, 34, ...

This is called the Fibonacci sequence.

Sometimes we want to find the sum of the terms in a sequence

Summation notation lets us compactly represent the sum of terms $a_m + a_{m+1} + \dots + a_n$

$$\sum_{j=m}^n a_j = \sum_{m \leq j \leq n} a_j$$

Upper limit

Index of summation

Lower limit

Example: $\sum_{1 \leq i \leq 5} i^2 = 1 + 4 + 9 + 16 + 25 = 55$

The usual laws of arithmetic still apply

$$\sum_{j=1}^n (ax_j + by_j - cz_j) = a \sum_{j=1}^n x_j + b \sum_{j=1}^n y_j - c \sum_{j=1}^n z_j$$

Constant factors can be pulled out of the summation

A summation over a sum (or difference) can be split into a sum (or difference) of smaller summations

Example:

- $\sum_{1 \leq j \leq 3} (4j + j^2) =$
- $4\sum_{1 \leq j \leq 3} j + \sum_{1 \leq j \leq 3} j^2 =$

Example sums

Example: Express the sum of the first 50 terms of the sequence $1/n^2$ for $n = 1, 2, 3, \dots$

Answer:
$$\sum_{j=1}^{50} \frac{1}{j^2}$$

Example: What is the value of $\sum_{k=4}^8 (-1)^k$

Answer:
$$\begin{aligned} \sum_{k=4}^8 (-1)^k &= \\ &= \\ &= \end{aligned}$$

We can also compute the summation of the elements of some set

Example: Compute $\sum_{s \in \{0, 2, 4, 6\}} (s + 2)$

Answer: $(0 + 2) + (2 + 2) + (4 + 2) + (6 + 2) = 20$

Example: Let $f(x) = x^3 + 1$. Compute $\sum_{s \in \{1, 3, 5, 7\}} f(s)$

Answer: $f(1) + f(3) + f(5) + f(7) = 2 + 28 + 126 + 344 = 500$

Sometimes it is helpful to shift the index of a summation

This is particularly useful when **combining** two or more summations. For example:

$$\begin{aligned}
 S &= \sum_{j=1}^{10} j^2 + \sum_{k=2}^{11} (2k - 1) && \text{Let } j = k - 1 \\
 &= \sum_{j=1}^{10} j^2 + \sum_{j=1}^{10} (2(j+1) - 1) && \text{Need to add 1 to each } j \\
 &= \sum_{j=1}^{10} (j^2 + 2(j+1) - 1) \\
 &= \sum_{j=1}^{10} (j^2 + 2j + 1) \\
 &= \sum_{j=1}^{10} (j+1)^2
 \end{aligned}$$

Summations can be nested within one another

Often, you'll see this when analyzing nested loops within a program (i.e., CS 1502)

Example: Compute $\sum_{j=1}^4 \sum_{k=1}^3 (jk)$ **Expand inner sum**

Solution: $\sum_{j=1}^4 \sum_{k=1}^3 (jk) = \sum_{j=1}^4 (j + 2j + 3j)$

$= \sum_{j=1}^4 6j$ **Simplify if possible**

$= 6 + 12 + 18 + 24 = 60$

Expand outer sum

Group work!

Problem 1: What are the formulas for the following sequences?

1. 3, 6, 9, 12, 15, ...
2. $1/3, 2/3, 4/3, 8/3, \dots$

Problem 2: Compute the following summations:

1. $\sum_{k=1}^5 (k+1)$
2. $\sum_{k=0}^8 (2^{k+1} - 2^k)$

Computing the sum of a geometric series by hand is time consuming...

Would you **really** want to calculate $\sum_{j=0}^{20} (6 \times 2^j)$ by hand?

Fortunately, we have a **closed-form solution** for computing the sum of a geometric series:

$$\sum_{j=0}^n ar^j = \begin{cases} \frac{ar^{n+1} - a}{r-1} & \text{if } r \neq 1 \\ (n+1)a & \text{if } r = 1 \end{cases}$$

$$\text{So, } \sum_{j=0}^{20} (6 \times 2^j) = \frac{6 \times 2^{21} - 6}{2 - 1} = 12,582,906$$

There are other closed form summations that you should know

<i>Sum</i>	<i>Closed Form</i>

We can use the notion of sequences to analyze the cardinality of infinite sets

Definition: Two sets A and B have the **same cardinality** if and only if there is a one-to-one correspondence from A to B.

Definition: A finite set or a set that has the same cardinality as the natural numbers is called **countable**. A set that is not countable is called **uncountable**.

Implication: Any sequence $\{a_n\}$ ranging over the natural numbers is countable.

Show that the set of even positive integers is countable

Proof #1 (Graphical): We have the following 1-to-1 correspondence between the natural numbers and the even positive integers:

1	2
2	4
3	6
4	8
5	10
6	12
7	14
8	16
9	18
10	20
...	...

So, the even positive integers are countable. \square

Proof #2: We can define the even positive integers as the sequence $\{2k\}$ for all $k \in \mathbf{N}$, so it has the same cardinality as \mathbf{N} , and is thus countable. \square

Final thoughts

- Sets are the basis of **functions**, which are used throughout computer science and mathematics
- Sequences allow us to represent (potentially infinite) ordered lists of elements
- Summation notation is a compact representation for adding together the elements of a sequence
- We can use sequences to help us compare the cardinality of infinite sets
