

Project Management, Preparation for real world, public speaking. This course was the most practical/beneficial class for me in CS when it came to ~~work~~ preparation for life after college.

Learning through practice how to use collaborative development tools (Source Control, Bug Tracking, etc.) necessary in a group environment.

Learning what the CS major does in a real work environment. The procedures & tools to use and tackle real problems.

This course offered an opportunity to learn about what we need to go up ~~to~~ the management level of the career. Not only communication skills, but also the ability of viewing a project as a whole. This course should be offered regularly to people who are interested in being leaders and manager in this field ~~in the future~~.

- great example of real world working
- Very great chance for group work
- D. one of the best classes for readying me for a job

The class is ~~not~~ one of a small number of courses that talk about working in groups, management, and life in the professional world. Such topics are really important and I would like to see them taught to future students.

Working as a group. Even the failures of this system of project development were very helpful. It stresses the importance of technical and non-technical communication.

This course emphasizes communication skill and practical software development skills. Having done few IT internships this course is very valuable in corporate world. It is ^{should be} an essential course in CS dept.

Presentation skills were improved
Peer-to-peer skills

Very beneficial course
