CS 1571 Intro to AI

M. Hauskrecht

### Probabilistic inference

Any query can be computed from the full joint distribution !!!

- **Joint over a subset of variables** is obtained through marginalization

$$P(A = a, C = c) = \sum_i \sum_j P(A = a, B = b_i, C = c, D = d_j)$$

- **Conditional probability over set of variables**, given other variables' values is obtained through marginalization and definition of conditionals

$$\begin{aligned} P(D = d \mid A = a, C = c) &= \frac{P(A = a, C = c, D = d)}{P(A = a, C = c)} \\ &= \frac{\sum_i P(A = a, B = b_i, C = c, D = d)}{\sum_i \sum_j P(A = a, B = b_i, C = c, D = d_j)} \end{aligned}$$

CS 1571 Intro to AI

M. Hauskrecht

## Probabilistic inference

Any query can be computed from the full joint distribution !!!

- Any joint probability can be expressed as a product of conditionals via the **chain rule**.

$$\begin{aligned} P(X_1, X_2, \dots, X_n) &= P(X_n | X_1, \dots, X_{n-1}) P(X_1, \dots, X_{n-1}) \\ &= P(X_n | X_1, \dots, X_{n-1}) P(X_{n-1} | X_1, \dots, X_{n-2}) P(X_1, \dots, X_{n-2}) \\ &= \prod_{i=1}^n P(X_i | X_1, \dots, X_{i-1}) \end{aligned}$$

## Modeling uncertainty with probabilities

- Defining the **full joint distribution** makes it possible to represent and reason with uncertainty in a uniform way
- We are able to handle an arbitrary inference problem

### Problems:

- **Space complexity.** To store a full joint distribution we need to remember  $O(d^n)$  numbers.  
 $n$  – number of random variables,  $d$  – number of values
- **Inference (time) complexity.** To compute some queries requires  $O(d^n)$  steps.
- **Acquisition problem.** Who is going to define all of the probability entries?

## Medical diagnosis example

- **Space complexity.**

- Pneumonia (2 values: T,F), Fever (2: T,F), Cough (2: T,F), WBCcount (3: high, normal, low), paleness (2: T,F)
- Number of assignments:  $2*2*2*3*2=48$
- We need to define at least 47 probabilities.

- **Time complexity.**

- Assume we need to compute the marginal of  $P(\text{Pneumonia}=T)$  from the full joint

$$P(\text{Pneumonia} = T) = \sum_{i \in T, F} \sum_{j \in T, F} \sum_{k=h,n,l} \sum_{u \in T, F} P(\text{Fever} = i, \text{Cough} = j, \text{WBCcount} = k, \text{Pale} = u)$$

- Sum over:  $2*2*3*2=24$  combinations

## Modeling uncertainty with probabilities

- **Knowledge based system era (70s – early 80's)**

- **Extensional non-probabilistic models**
- Solve the space, time and acquisition bottlenecks in probability-based models
- froze the development and advancement of KB systems and contributed to the slow-down of AI in 80s in general

- Breakthrough (late 80s, beginning of 90s)

- **Bayesian belief networks**
  - Give solutions to the space, acquisition bottlenecks
  - Partial solutions for time complexities

## Bayesian belief networks (BBNs)

### Bayesian belief networks

- Represent the full joint distribution over the variables more compactly with a **smaller number of parameters**.
- Take advantage of **conditional and marginal independences** among random variables

- **A and B are independent**

$$P(A, B) = P(A)P(B)$$

- **A and B are conditionally independent given C**

$$P(A, B | C) = P(A | C)P(B | C)$$

$$P(A | C, B) = P(A | C)$$

## Alarm system example

- Assume your house has an **alarm system** against **burglary**. You live in the seismically active area and the alarm system can get occasionally set off by an **earthquake**. You have two neighbors, **Mary** and **John**, who do not know each other. If they hear the alarm they call you, but this is not guaranteed.
- We want to represent the probability distribution of events:
  - Burglary, Earthquake, Alarm, Mary calls and John calls

### Causal relations

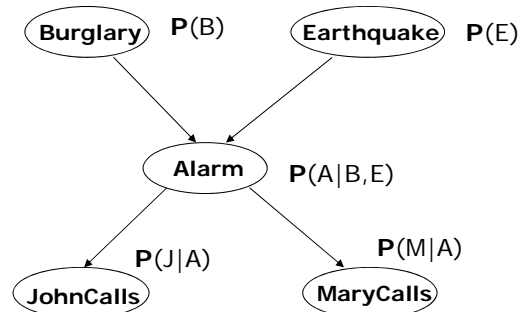

## Bayesian belief network

### 1. Directed acyclic graph

- **Nodes** = random variables  
Burglary, Earthquake, Alarm, Mary calls and John calls
- **Links** = direct (causal) dependencies between variables.

The chance of Alarm is influenced by Earthquake, The chance of John calling is affected by the Alarm

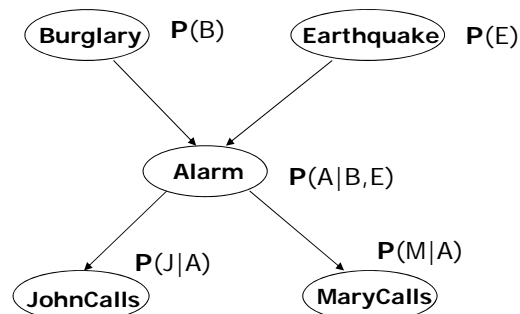

CS 1571 Intro to AI

M. Hauskrecht

## Bayesian belief network

### 2. Local conditional distributions

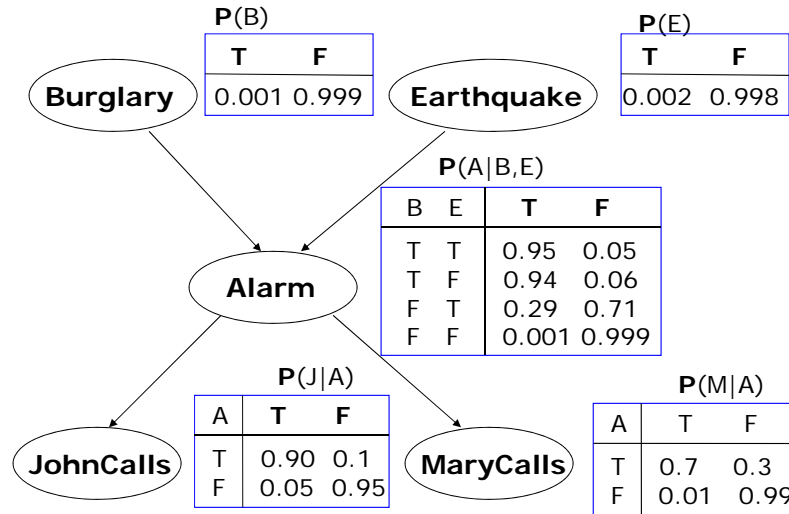

- relate variables and their parents

CS 1571 Intro to AI

M. Hauskrecht

## Bayesian belief network

CS 1571 Intro to AI

M. Hauskrecht

## Bayesian belief networks (general)

Two components:  $B = (S, \Theta_S)$

- Directed acyclic graph**

- Nodes correspond to random variables
- (Missing) links encode independences

- Parameters**

- Local conditional probability distributions for every variable-parent configuration

$$P(X_i | pa(X_i))$$

Where:

$pa(X_i)$  - stand for parents of  $X_i$

**P(A|B,E)**

B	E	T	F
T	T	0.95	0.05
T	F	0.94	0.06
F	T	0.29	0.71
F	F	0.001	0.999

CS 1571 Intro to AI

M. Hauskrecht

## Full joint distribution in BBNs

**Full joint distribution** is defined in terms of local conditional distributions (obtained via the chain rule):

$$P(X_1, X_2, \dots, X_n) = \prod_{i=1, \dots, n} P(X_i \mid pa(X_i))$$

### Example:

Assume the following assignment of values to random variables

$$B=T, E=T, A=T, J=T, M=F$$

Then its probability is:

$$P(B=T, E=T, A=T, J=T, M=F) =$$

$$P(B=T)P(E=T)P(A=T \mid B=T, E=T)P(J=T \mid A=T)P(M=F \mid A=T)$$

## Bayesian belief networks (BBNs)

### Bayesian belief networks

- Represent the full joint distribution over the variables more compactly using the product of local conditionals.
- But how did we get to local parameterizations?

### Answer:

- **Graphical structure** encodes **conditional and marginal independences** among random variables

- **A and B are independent**  $P(A, B) = P(A)P(B)$

- **A and B are conditionally independent given C**

$$P(A \mid C, B) = P(A \mid C) \quad P(A, B \mid C) = P(A \mid C)P(B \mid C)$$

- **The graph structure implies the decomposition !!!**

## Independences in BBNs

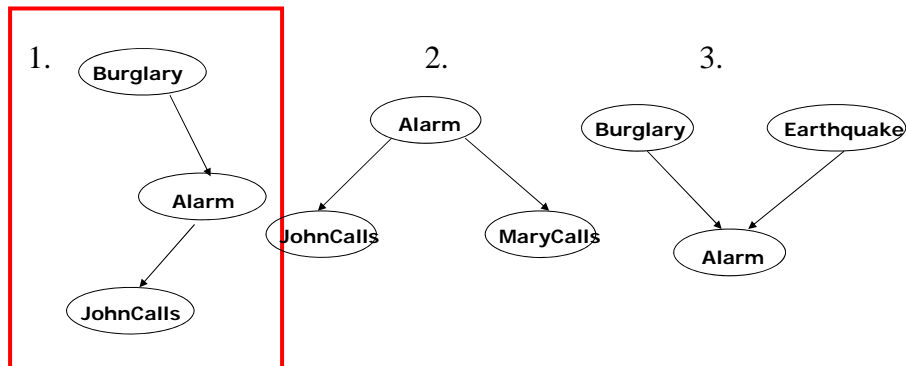

3 basic independence structures:

CS 1571 Intro to AI

M. Hauskrecht

## Independences in BBNs

1. JohnCalls is **independent** of Burglary given Alarm

$$P(J \mid A, B) = P(J \mid A)$$

$$P(J, B \mid A) = P(J \mid A)P(B \mid A)$$

CS 1571 Intro to AI

M. Hauskrecht

## Independences in BBNs

2. MaryCalls **is independent** of JohnCalls given Alarm

$$P(J \mid A, M) = P(J \mid A)$$

$$P(J, M \mid A) = P(J \mid A)P(M \mid A)$$

## Independences in BBNs

3. Burglary **is independent** of Earthquake (not knowing Alarm)  
Burglary and Earthquake **become dependent** given Alarm !!

$$P(B, E) = P(B)P(E)$$

## Independences in BBN

- BBN distribution models many conditional independence relations among distant variables and sets of variables
- These are defined in terms of the graphical criterion called d-separation
- **D-separation and independence**
  - Let X, Y and Z be three sets of nodes
  - If X and Y are d-separated by Z, then X and Y are conditionally independent given Z
- **D-separation :**
  - A is d-separated from B given C if every undirected path between them is **blocked with C**
- **Path blocking**
  - 3 cases that expand on three basic independence structures

CS 1571 Intro to AI

M. Hauskrecht

## Undirected path blocking

A is d-separated from B given C if every undirected path between them is **blocked**

CS 1571 Intro to AI

M. Hauskrecht

## Undirected path blocking

A is d-separated from B given C if every undirected path between them is **blocked**

## Undirected path blocking

A is d-separated from B given C if every undirected path between them is **blocked**

- 1. Path blocking with a linear substructure

## Undirected path blocking

A is d-separated from B given C if every undirected path between them is **blocked**

- 2. Path blocking with the wedge substructure

## Undirected path blocking

A is d-separated from B given C if every undirected path between them is **blocked**

- 3. Path blocking with the V-structure (explain away)

## Independences in BBNs

- Earthquake and Burglary are independent given MaryCalls ?

## Independences in BBNs

- Earthquake and Burglary are independent given MaryCalls **F**
- Burglary and MaryCalls are independent (not knowing Alarm) ?

## Independences in BBNs

- Earthquake and Burglary are independent given MaryCalls **F**
- Burglary and MaryCalls are independent (not knowing Alarm) **F**
- Burglary and RadioReport are independent given Earthquake **?**

CS 1571 Intro to AI

M. Hauskrecht

## Independences in BBNs

- Earthquake and Burglary are independent given MaryCalls **F**
- Burglary and MaryCalls are independent (not knowing Alarm) **F**
- Burglary and RadioReport are independent given Earthquake **T**
- Burglary and RadioReport are independent given MaryCalls **?**

CS 1571 Intro to AI

M. Hauskrecht

## Independences in BBNs

- Earthquake and Burglary are independent given MaryCalls **F**
- Burglary and MaryCalls are independent (not knowing Alarm) **F**
- Burglary and RadioReport are independent given Earthquake **T**
- Burglary and RadioReport are independent given MaryCalls **F**

CS 1571 Intro to AI

M. Hauskrecht

## Bayesian belief networks (BBNs)

### Bayesian belief networks

- Represents the full joint distribution over the variables more compactly using the product of local conditionals.
- **So how did we get to local parameterizations?**

$$\mathbf{P}(X_1, X_2, \dots, X_n) = \prod_{i=1, \dots, n} \mathbf{P}(X_i \mid pa(X_i))$$

- **The decomposition is implied by the set of independences encoded in the belief network.**

CS 1571 Intro to AI

M. Hauskrecht

## Full joint distribution in BBNs

Rewrite the full joint probability using the product rule:

$$P(B=T, E=T, A=T, J=T, M=F) =$$

## Full joint distribution in BBNs

Rewrite the full joint probability using the product rule:

$$P(B=T, E=T, A=T, J=T, M=F) =$$

$$= P(J=T \mid B=T, E=T, A=T, M=F) P(B=T, E=T, A=T, M=F)$$

$$= \underline{P(J=T \mid A=T)} \underline{P(B=T, E=T, A=T, M=F)}$$

## Full joint distribution in BBNs

Rewrite the full joint probability using the product rule:

$$P(B=T, E=T, A=T, J=T, M=F) =$$

$$= P(J=T \mid B=T, E=T, A=T, M=F) P(B=T, E=T, A=T, M=F)$$

$$= \underline{P(J=T \mid A=T)} \underline{P(B=T, E=T, A=T, M=F)}$$

$$P(M=F \mid B=T, E=T, A=T) P(B=T, E=T, A=T)$$

$$\underline{P(M=F \mid A=T)} \underline{P(B=T, E=T, A=T)}$$

## Full joint distribution in BBNs

Rewrite the full joint probability using the product rule:

$$P(B=T, E=T, A=T, J=T, M=F) =$$

$$= P(J=T \mid B=T, E=T, A=T, M=F) P(B=T, E=T, A=T, M=F)$$

$$= \underline{P(J=T \mid A=T)} \underline{P(B=T, E=T, A=T, M=F)}$$

$$P(M=F \mid B=T, E=T, A=T) P(B=T, E=T, A=T)$$

$$\underline{P(M=F \mid A=T)} \underline{P(B=T, E=T, A=T)}$$

$$\underline{P(A=T \mid B=T, E=T)} \underline{P(B=T, E=T)}$$

## Full joint distribution in BBNs

Rewrite the full joint probability using the product rule:

$$P(B=T, E=T, A=T, J=T, M=F) =$$

$$= P(J=T \mid B=T, E=T, A=T, M=F) P(B=T, E=T, A=T, M=F)$$

$$= \underline{P(J=T \mid A=T)} \underline{P(B=T, E=T, A=T, M=F)}$$

$$P(M=F \mid B=T, E=T, A=T) P(B=T, E=T, A=T)$$

$$\underline{P(M=F \mid A=T)} \underline{P(B=T, E=T, A=T)}$$

$$\underline{P(A=T \mid B=T, E=T)} \underline{P(B=T, E=T)}$$

$$P(B=T) P(E=T)$$

CS 1571 Intro to AI

M. Hauskrecht

## Full joint distribution in BBNs

Rewrite the full joint probability using the product rule:

$$P(B=T, E=T, A=T, J=T, M=F) =$$

$$= P(J=T \mid B=T, E=T, A=T, M=F) P(B=T, E=T, A=T, M=F)$$

$$= \underline{P(J=T \mid A=T)} \underline{P(B=T, E=T, A=T, M=F)}$$

$$P(M=F \mid B=T, E=T, A=T) P(B=T, E=T, A=T)$$

$$\underline{P(M=F \mid A=T)} \underline{P(B=T, E=T, A=T)}$$

$$\underline{P(A=T \mid B=T, E=T)} \underline{P(B=T, E=T)}$$

$$P(B=T) P(E=T)$$

$$= P(J=T \mid A=T) P(M=F \mid A=T) P(A=T \mid B=T, E=T) P(B=T) P(E=T)$$

CS 1571 Intro to AI

## Parameter complexity problem

- In the BBN the **full joint distribution** is defined as:

$$\mathbf{P}(X_1, X_2, \dots, X_n) = \prod_{i=1, \dots, n} \mathbf{P}(X_i \mid \text{pa}(X_i))$$

- What did we save?

Alarm example: 5 binary (True, False) variables

# of parameters of the full joint:

$$2^5 = 32$$

One parameter is for free:

$$2^5 - 1 = 31$$

## Parameter complexity problem

- In the BBN the **full joint distribution** is defined as:

$$\mathbf{P}(X_1, X_2, \dots, X_n) = \prod_{i=1, \dots, n} \mathbf{P}(X_i \mid \text{pa}(X_i))$$

- What did we save?

Alarm example: 5 binary (True, False) variables

# of parameters of the full joint:

$$2^5 = 32$$

One parameter is for free:

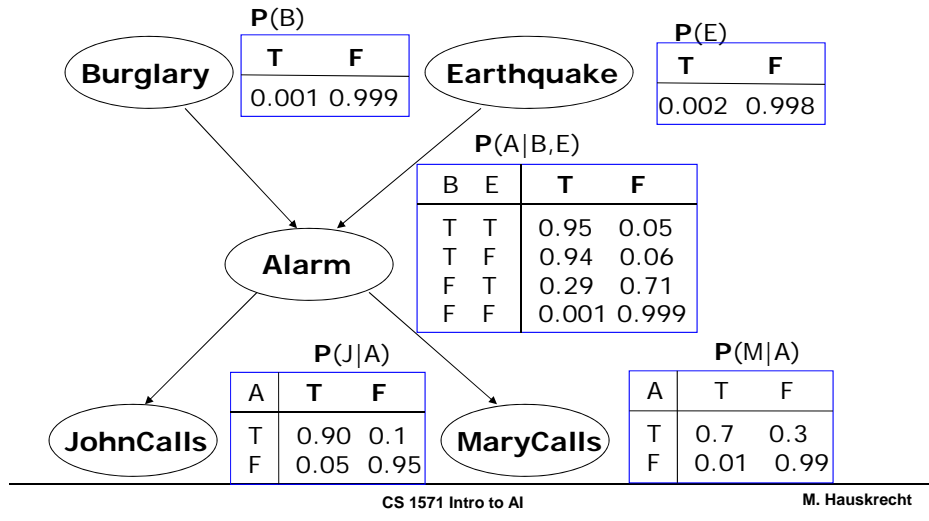

$$2^5 - 1 = 31$$

# of parameters of the BBN: ?

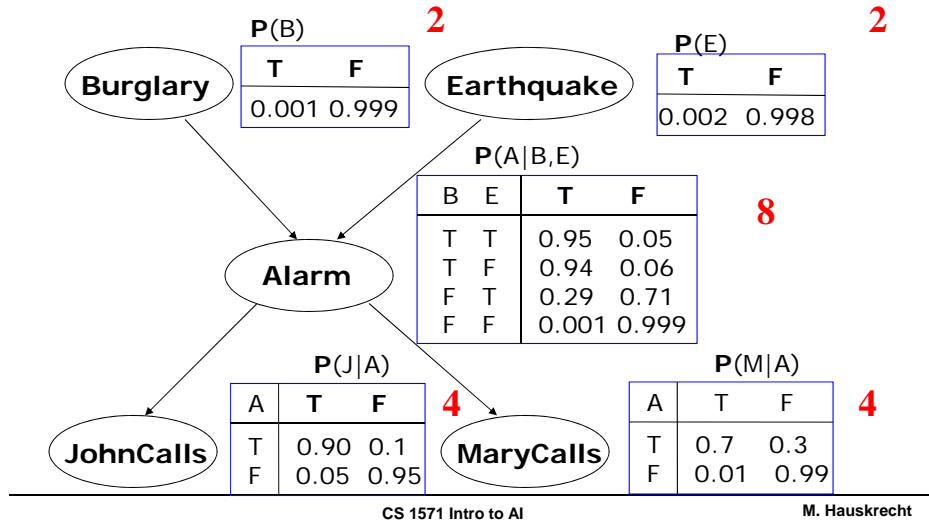

## Bayesian belief network.

- In the BBN the **full joint distribution** is expressed using a set of local conditional distributions

## Bayesian belief network.

- In the BBN the **full joint distribution** is expressed using a set of local conditional distributions

## Parameter complexity problem

- In the BBN the **full joint distribution** is defined as:

$$\mathbf{P}(X_1, X_2, \dots, X_n) = \prod_{i=1, \dots, n} \mathbf{P}(X_i \mid \text{pa}(X_i))$$

- What did we save?

Alarm example: 5 binary (True, False) variables

# of parameters of the full joint:

$$2^5 = 32$$

One parameter is for free:

$$2^5 - 1 = 31$$

# of parameters of the BBN:

$$2^3 + 2(2^2) + 2(2) = 20$$

One parameter in every conditional is for free:

?

CS 1571 Intro to AI

M. Hauskrecht

## Parameter complexity problem

- In the BBN the **full joint distribution** is defined as:

$$\mathbf{P}(X_1, X_2, \dots, X_n) = \prod_{i=1, \dots, n} \mathbf{P}(X_i \mid \text{pa}(X_i))$$

- What did we save?

Alarm example: 5 binary (True, False) variables

# of parameters of the full joint:

$$2^5 = 32$$

One parameter is for free:

$$2^5 - 1 = 31$$

# of parameters of the BBN:

$$2^3 + 2(2^2) + 2(2) = 20$$

One parameter in every conditional is for free:

$$2^2 + 2(2) + 2(1) = 10$$

M. Hauskrecht

## Model acquisition problem

### The structure of the BBN

- typically reflects causal relations  
(BBNs are also sometime referred to as **causal networks**)
- Causal structure is intuitive in many applications domain and it is relatively easy to define to the domain expert

### Probability parameters of BBN

- are conditional distributions relating random variables and their parents
- Complexity is much smaller than the full joint
- It is much easier to obtain such probabilities from the expert or learn them automatically from data
