Course administration

- **Homework 8 : Due today**
- **No homework next week**
- **Midterm exam 2**
 - **Thursday, November 12, 2009**
 - **Covers only the material after midterm 1**
 - **Integers (Primes, Division, Congruencies)**
 - **Sequences and Summations**
 - **Inductive proofs and Recursion**
 - **Counting**

Course web page:

<http://www.cs.pitt.edu/~milos/courses/cs441/>

Probabilities

- **Experiment:**
 - a procedure that yields one of the possible outcomes
- **Sample space:** a set of possible outcomes
- **Event:** a subset of possible outcomes (E is a subset of S)
- **Assuming the outcomes are equally likely, the probability of an event E, defined by a subset of outcomes from the sample space S is**
 - $P(E) = |E| / |S|$
- The cardinality of the subset divided by the cardinality of the sample space.

Probabilities

- Event E, Sample space S, all outcomes equally likely, then
$$P(E) = |E| / |S|$$

Example:

- roll of two dices
- What is the probability that the outcome is 7.
- All possible outcomes (sample space S):
- (1,6) (2,6) ... (6,1), ... (6,6) total: 36
- Outcomes leading to 7 (event E)
- (1,6) (2,5) ... (6,1) total: 6
- $P(\text{sum}=7) = 6/36 = 1/6$

Probabilities

- Event E, Sample space S, all outcomes equally likely, then

$$P(E) = |E| / |S|$$

Example:

- Odd of winning a lottery: 6 numbers out of 40.
- Total number of outcomes (sample space S):
 - $C(40,6) = 3,838,380$
- Winning combination (event E): 1
- Probability of winning:
 - $P(E) = 1/C(40,6) = 34! \cdot 6! / 40! = 1/3,838,380$

Probabilities

- Event E, Sample space S, all outcomes equally likely, then

$$P(E) = |E| / |S|$$

Example (cont):

- Odd of winning a second prize in lottery: 6 numbers out of 40.
- Total number of outcomes (sample space S):
 - $C(40,6) = 3,838,380$
- Second prize (event E): $C(6,5) \cdot (40-6) = 6 \cdot 34$
- Probability of winning:
 - $P(E) = 6 \cdot 34 / C(40,6) = (6 \cdot 34) / 3,838,380$

Probabilities

- Event E, Sample space S, all outcomes equally likely, then

$$P(E) = |E| / |S|$$

Another lottery:

- 6 numbers with repetitions out of 40 numbers
- Total number of outcomes:
 - Permutations with repetitions: $= 40^6$
- Number of winning configuration: 1
 - $P(\text{win}) = 1/40^6$

And its modification:

- If the winning combination is order independent:
 - E.g. (1,5,17,25,5,13) is equivalent to (5,17,5,1,25,13)
 - Number of winning permutations = number of permutations of 6 = $6!$
 - $P(\text{win}) = 6! / 40^6$

Probabilities

Theorem: Let E be an event and $\sim E$ its complement with regard to S. Then:

- $P(\sim E) = 1 - P(E)$

Sample space

Proof.

$$P(\sim E) = (|S| - |E|) / |S| = 1 - |E| / |S|$$

Probabilities

Example:

- 10 randomly generated bits. What is the probability that there is at least one zero in the string.

- Event: seeing no-zero string $P(E) = 1/2^{10}$
- \sim Event: seeing at least one zero in the string
 $P(\sim E) = 1 - P(E) = 1 - 1/2^{10}$

M. Hauskrecht

Probabilities

Theorem. Let $E1$ and $E2$ be two events in the sample space S .
Then:

- $P(E1 \cup E2) = P(E1) + P(E2) - P(E1 \text{ and } E2)$
- This is an example of the inclusion-exclusion principle

M. Hauskrecht

Probabilities

Theorem. Let E_1 and E_2 be two events in the sample space S .

Then:

- $P(E_1 \cup E_2) = P(E_1) + P(E_2) - P(E_1 \text{ and } E_2)$

Example: Probability that a positive integer ≤ 100 is divisible either by 2 or 5.

- $P(E_1) = 50/100$
- $P(E_2) = 20/100$
- $P(E_1 \text{ and } E_2) = 10/100$
- $P(E_1 \cup E_2) = (5+2-1)/10 = 6/10$

Probabilities

- Assumption applied so far:
 - **the probabilities of each outcome are equally likely.**
- However in many cases outcome may not be equally likely.

Example: a biased coin or a biased dice.

- Probability of head 0.6, probability of a tail 0.4.

Probabilities

Three axioms of the probability theory:

- Probability of a discrete outcome is:
 - $0 \leq P(s) \leq 1$
- Sum of probabilities of all outcomes is $= 1$
- For any two events E1 and E2 holds:
$$P(E1 \cup E2) = P(E1) + P(E2) - P(E1 \text{ and } E2)$$

M. Hauskrecht

Probabilities

Definition: A function $p: S \rightarrow [0,1]$ satisfying the three conditions is called a **probability distribution**

Example: a biased coin

- Probability of head 0.6, probability of a tail 0.4
- **Probability distribution:**
 - Head $\rightarrow 0.6$ The sum of the probabilities sums to 1
 - Tail $\rightarrow 0.4$

Note: a **uniform distribution** is a special distribution that assigns an equal probability to each outcome.

M. Hauskrecht

Conditional probability

Definition: Let E and F be two events such that $P(F) > 0$. The **conditional probability** of E given F

- $P(E|F) = P(E \text{ and } F) / P(F)$

Example:

- What is the probability that a family has two boys given that they have at least one boy. Assume the probability of having a girl or a boy is equal.
- **Possibilities. BB BG GB GG**
- $P(BB) = 1/4$
- $P(\text{one boy}) = 3/4$
- $P(BB|\text{given a boy}) = 1/4 / 3/4 = 1/3$

M. Hauskrecht

Conditional probability

Definition: Let E and F be two events such that $P(F) > 0$. The **conditional probability** of E given F

- $P(E|F) = P(E \text{ and } F) / P(F)$

Example:

- What is the probability that a family has two boys given that they have at least one boy. Assume the probability of having a girl or a boy is equal.
- **Possibilities. BB BG GB GG**
- $P(BB) = 1/4$
- $P(\text{one boy}) = 3/4$
- $P(BB|\text{given a boy}) = 1/4 / 3/4 = 1/3$

BB BG GB GG

M. Hauskrecht

Conditional probability

Corrolary: Let E and F be two events such that $P(F) > 0$. Then:

- $P(E \text{ and } F) = P(E|F) P(F)$

Proof:

- From the definition of the conditional probability:

$$P(E|F) = P(E \text{ and } F) / P(F)$$

→

$$P(E \text{ and } F) = P(E|F) P(F)$$

M. Hauskrecht

Conditional probability

Corrolary: Let E and F be two events such that $P(F) > 0$. Then:

- $P(E \text{ and } F) = P(E|F) P(F)$

Example:

- Assume the probability of getting a flu is 0.2
- Assume the probability of having a high fever given the flu: 0.9

What is the probability of getting a flu with fever?

$$P(\text{flu and fever}) = P(\text{fever}|\text{flu})P(\text{flu}) = 0.9 \cdot 0.2 = 0.18$$

- When is this useful?

Sometimes conditional probabilities are easier to estimate.

M. Hauskrecht

Bayes theorem

Definition: Let E and F be two events such that $P(F) > 0$. Then:

- $P(E|F) = P(F|E)P(E) / P(F)$

Proof:

$$\begin{aligned} P(E|F) &= P(F \text{ and } E) / P(F) \\ &= P(F|E)P(E) / P(F) \end{aligned}$$

Idea: Simply switch the conditioning events.

M. Hauskrecht

Bayes theorem

Definition: Let E and F be two events such that $P(F) > 0$. Then:

- $P(E|F) = P(F|E)P(E) / P(F)$

Example:

- Assume the probability of getting a flu is 0.2
- Assume the probability of getting a fever is 0.3
- Assume the probability of having a high fever given the flu: 0.9
- What is the probability of having a flu given the fever?
- $P(\text{flu} | \text{fever}) = P(\text{fever}|\text{flu}) P(\text{flu}) / P(\text{fever}) =$
 $= 0.9 \times 0.2 / 0.3 = 0.18 / 0.3 = 0.3$

M. Hauskrecht

Independence

Definition: The events E and F are said to be **independent** if:

- $P(E \text{ and } F) = P(E)P(F)$

Example. Assume that E denotes the family has three children of both sexes and F the fact that the family has at most one boy. Are E and F independent?

- All combos = {BBB, BBG, BGB, GBB, BGG, GBG, GGB, GGG} the number of elements = 8
- Both sexes = {BBG BGB GBB BGG GBG GGB} # = 6
- At most one boy = {GGG GGB GBG BGG} # = 4
- E and F = {GGB GBG BGG} # = 3
- $P(E \text{ and } F) = 3/8$ and $P(E) \cdot P(F) = 4/8 \cdot 6/8 = 3/8$

M. Hauskrecht

Independence

Definition: The events E and F are said to be **independent** if:

- $P(E \text{ and } F) = P(E)P(F)$

Example. Assume that E denotes the family has three children of both sexes and F the fact that the family has at most one boy. Are E and F independent?

- All combos = {BBB, BBG, BGB, GBB, BGG, GBG, GGB, GGG} the number of elements = 8
- Both sexes = {BBG BGB GBB BGG GBG GGB} # = 6
- At most one boy = {GGG GGB GBG BGG} # = 4
- E and F = {GGB GBG BGG} # = 3
- $P(E \text{ and } F) = 3/8$ and $P(E) \cdot P(F) = 4/8 \cdot 6/8 = 3/8$
- **The two probabilities are equal \rightarrow E and F are independent**

M. Hauskrecht
